AutomataGroups 2

Abstract

This is a manual for an

AutomataGroups

package, implementing in GAP basic functions and algorithms for groups generated by finite automat a, contracting groups.

Acknowledgements

The development of this package was partially supported by National Science Foundation

Colophon

The project was originally started in 2000 mostly for personal use. It was gradually expadnig during consequent years, including both addition of new algorithms and simplification of user interface. It was used in the process of classification of groups generated by 3-state automata over 2-letter alphabet.

	omata groups
2.1	Trees
	2.1.1 VertexNumber
	2.1.2 NumberOfVertex
2.2	Tree Automorphisms
	2.2.1 OrbitOfVertex
	2.2.2 PrintOrbitOfVertex

Chapter 1

Introduction

- 1.1 Mathematical Background
- 1.2 Notations and Agreements
- 1.3 Quick Example

Chapter 2

Automata groups

2.1 Trees

These functions allow to construct and operate with vertices of the trees.

2.1.1 VertexNumber

```
♦ VertexNumber( num, lev, deg ) (function)
```

One can naturally enumerate all the vertices of the *lev*-th level of the deg-ary tree by n umbers $1, \ldots, deg^n$. This function returns the vertex of this level, which has number num.

```
gap> VertexNumber(1,3,2);
[ 1, 1, 1 ]
gap> VertexNumber(4,4,3);
[ 1, 1, 2, 1 ]
```

2.1.2 NumberOfVertex

Let ver belong to n-th level of the deg-ary tree. One can naturally enume rate all the vertices of this level by numbers $1, \ldots, deg^n$. This function returns the number, which corresponds to the vertex ver.

```
gap> NumberOfVertex([1,2,1,2],2);
6
gap> NumberOfVertex("333",3);
27
```

2.2 Tree Automorphisms

These functions allow to construct orbit of vertex.

AutomataGroups 6

2.2.1 OrbitOfVertex

```
♦ OrbitOfVertex( ver, g[, n] ) (operation)
```

Returns the list of vertics in the orbit of vertex ver under the action of a semigroup gene rated by an automorphism g. If n is specified returns only first n elements of the orbit. Vertices are defined either as lists with entries from [1..d], or as strings containing characters 1,...,d, where d is the degree of the tree.

```
gap> g:=AutomGroup("t=(1,t)(1,2)");;
gap> OrbitOfVertex([1,1,1],t);
[ [ 1, 1, 1 ], [ 2, 1, 1 ], [ 1, 2, 1 ], [ 2, 2, 1 ], [ 1, 1, 2 ], [ 2, 1, 2 ], [ 1, 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2 ], [ 2, 2, 2, 2 ], [ 2, 2, 2, 2 ], [ 2, 2, 2, 2 ], [ 2, 2, 2, 2, 2 ], [ 2, 2, 2, 2, 2 ], [ 2, 2, 2, 2, 2, 2 ], [ 2, 2, 2, 2, 2, 2, 2, 2,
```

2.2.2 PrintOrbitOfVertex

```
\Diamond PrintOrbitOfVertex( ver, g[, n]) (operation)
```

Prints the orbit of vertex ver under the action of a semigroup generated by an automorphism g. Each vertex is printed as a string containing characters 1,...,d, wher e d is the degree of the tree. In case of binary tree the symbols ' ' and 'x' are used to represent 1 and 2. If n is specified only first n elements of the orbit are printed. Vertices are defined either as lists with entries from [1..d], or as strings

```
Example
gap> g:=AutomGroup("a=(b,a)(1,2),b=(b,a)");;
gap> PrintOrbitOfVertex("2222222222222222222222222222222",a*b^-2,6);
XX XX XX XX XX XX XX
XXX XXX XXX XXX XXX XXX XXX
      XXXX XXXX XXXX
gap> h:=AutomGroup("a=(b,1,1)(1,2,3),b=(a,b,a)(1,2)");;
gap> PrintOrbitOfVertex([1,2,1],b^2);
121
132
123
131
122
133
```
